C4 model · Level 1 of 4

Vesta: Level 1: System context

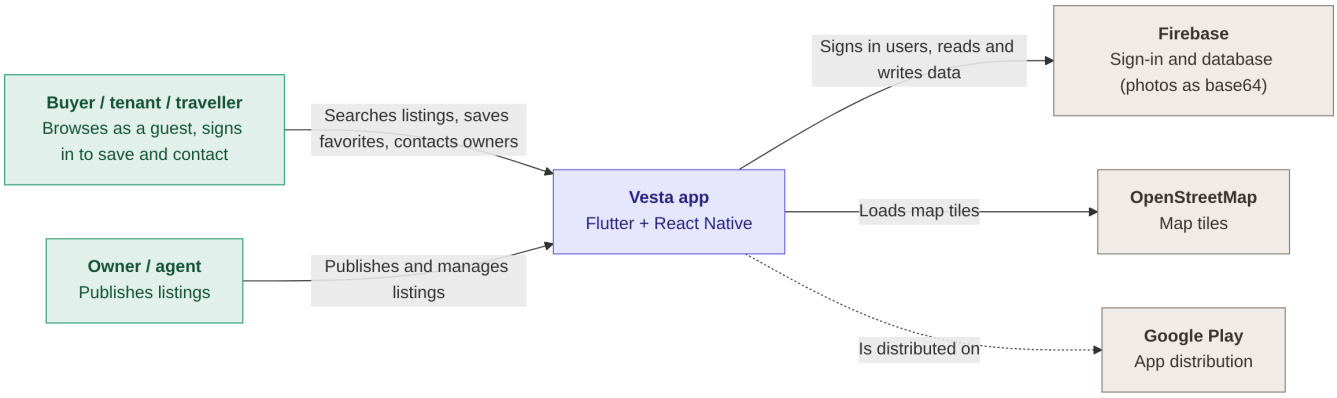

Project: real estate mobile app (Flutter and React Native)

Question answered by this level: Who uses Vesta, and which outside systems does it talk to?

Description

The context diagram is the big picture, like looking at the whole country on a map. It shows Vesta as one box, the people who use it and the outside services it depends on. It has no technical detail.

Diagram

Elements of the diagram

Element	Role
Buyer / tenant / traveller	Searches listings with filters, browses as a guest, and signs in to save favorites and contact owners.
Owner / agent	Publishes and manages listings for sale, rent or stay, and answers messages.
Vesta app	Mobile app to search, publish and chat about real estate listings, built in two versions (Flutter and React Native).
Firebase	Google service that provides sign-in and the database (Firestore). Photos are stored in Firestore as compressed base64.
OpenStreetMap	Provides the map tiles. Free, no billing account needed.
Google Play	App store through which Vesta is distributed.

Key points

- Both types of users use the same app. Guests can browse without an account.
- Vesta relies on outside services instead of rebuilding everything.
- Beige boxes are outside our control, the purple box is what we build.
- Decisions of 8 Oct: OpenStreetMap instead of Google Maps, photos in Firestore instead of Firebase Storage.
